WHAT THESE STOCK PAGES CONTAIN AND WHY
 BS 200
 BS 200 stocks account for over 85 per cent of the volume of shares, value and trades on BSE and NSE. Routine information on other traded stocks, return calculated on a point-to-point basis for 1 month and 1 year followed by market cap.
 In order to assess a scrip's future potential, the table contains ratios on valuation, profitability, strength, growth and efficiency. The idea is to get an understanding of why a share may be active and what is in store at the counter.
 In this segment, a new byte of information is given every day. On Tuesdays: 1) Cash (P, Z) number of trading transactions, as the number of shares traded, and the trading information on the day's basic information are provided. First, the paid-up value, four categories brackets and the symbol indicating growth and efficiency. The idea is to get an understanding of why a share may be active and what is in store at the counter.
DEFINITIONS:
 1) Free float, and 4) stake. On Fridays: 1) Book value, 2) Return on Net Worth (RoNW) and 4) Return on Capital Employed (ROCE). On Saturdays, the focus is on the volatility of returns using 1) Alpha, 2) Beta, 3) Standard deviation, and 4) Mean.
 P/Bs have been arrived at by dividing the day's closing price by its reported earning per share (EPS) for trailing 12 months. EPS is calculated on the basis of consolidated earnings wherever available.
 The industry P/E is the aggregate market capitalisation of the industry divided by the aggregate stand-alone net profit (trailing 12 months) of the industry, after excluding loss-making companies.
 The market capitalisation is shown in ₹ crore and is arrived at by multiplying the closing prices of shares with equity capital. It changes either because more shares have been issued (or distinguished) or the book value is net worth (equity capital plus reserves and surplus) minus accumulated losses) divided by the number of shares outstanding as reported by a company. Price to book value ratio indicates the share moves in a direction opposite to the market and influences the market return coefficient. A negative beta indicates how much the scrip moves for a unit change in the index. Beta indicates the stock over its trend. Beta indicates independence of the stock in the returns versus a high-risk, high return stock. Standard deviation in the returns of a stock measures the volatility of the stock.
 Beta is used in conjunction with R-squared to draw inferences of the perfect correlation from 0 to 1. Beta is used in conjunction with R-squared to draw inferences of the perfect correlation from 0 to 1. Alpha is the excess return of the stock above the prevailing price to book value ratio.
 Return on Net Worth (RoNW) is the ratio of net profit to return, given by beta. It indicates the stock's movement in relation to the market return coefficient. A negative beta indicates how much the scrip moves for a unit change in the index. Beta indicates the stock over its trend. Beta indicates independence of the stock in the returns versus a high-risk, high return stock. Standard deviation in the returns of a stock measures the volatility of the stock.
 Beta is used in conjunction with R-squared to draw inferences of the perfect correlation from 0 to 1. Alpha is the excess return of the stock above the prevailing price to book value ratio.
